

1 Data: Cats and Dogs

The following data are available on Beachboard.

1. PatternRecData.mat which contains two variables: the 198-by-198 matrix KLDATA.mat and a row vector sub-labels of length 160. The data matrix KLDATA contains distinct images of cats and dogs (courtesy of Dave Bolme and Dr. Ross J. Beveridge, Department of Computer Science, Colorado State University) in its columns. There are 99 of each animal and they are randomly placed in the columns of KLDATA. The vector sub-labels gives you the identity (with cat = 1 and dog = 0) of the first 160 patterns.
2. TIFFtraining.zip which contains TIFF images for the first 160 patterns in KLDATA. There is a little glitch to the file Dog96.tif, which is a 64×64 *times2* matrix instead of simply 64×64 . The first layer is what you would need.

2 Problem Assignment

Use the data given above to build different pattern recognition architectures from the methods that you learned in class over the semester or methods you acquired elsewhere that are relevant to the problem. *Include as many methods as the number of members in the group. Note there is no limit to group size but that the entire group will receive the same grade.*

Submit a write-up that that are coherent to the format described in Section 4. Once you are satisfied with your pattern recognition routine on the known data, classify the last 38 unknown columns in KLDATA as either cats or dogs. Save the result as a row vector of zeros (= dogs) and ones (= cats) and upload it under BeachBoard/Dropbox/Finalproject by the due date. Alternatively, if you wish to classify the raw data (instead of the KL data), you would design your classifier to take in either a 4096-by-1 column vector or a 4096-by-38 matrix and output their class labels as either cats or dogs.

Your final write-up will include the following items.

1. Classification errors as a 2-by-2 confusion matrix (dogs classified as dogs, dogs classified as cats, cats classified as cats, cats classified as dogs). You can accomplish this by splitting the data into testing and training and provide classification errors on the testing set.
2. Description of the classification method and details about how the classifier is constructed.
3. Predicted class membership for the 38 unlabeled data.
4. Print-out of all codes used in the exploration process.

3 Suggestions for Possible Approaches

The following list is by no means complete. The purpose is to provide you with some initial directions.

1. Determine the covariance matrix of the cats and the covariance matrix of the dogs and construct optimal bases for each using maximum noise fraction. Project new samples onto the cat basis and dog basis and see which gives a better representation.
2. Use vector quantization, e.g, Kohonen's self-organizing map on a 2D lattice.

3. Use eigen-cats and eigen-dogs and the Principal Component Analysis (PCA) on the raw data.
4. 2D Discrete Wavelet Analysis (DWT) or Fourier Analysis on the raw data for frequency content information.
5. Radial Basis Function (map cats to ones and dogs to zeros).
6. Fisher's Linear Discriminant Analysis (FDA).
7. Labeled Voronoi cell classification.
8. One-sided or two-sided tangent distances.
9. Set-to-set comparison with principal angles and Grassmannian distances.
10. A combination of any of the methods above with weights.

4 Grade

Your project grade will be partially based on how well your classifier performs on the given data set and partially based on how well your final report is written. The following is the expected format for your final report:

1. Title, author(s), affiliation, institution address, and short (≤ 250 words) abstract.
2. Sec. I. Introduction and Overview (of the problem)
3. Sec. II. Theoretical Background (of the method(s) you adopt)
4. Sec. III. Algorithm Implementation and Development
5. Sec. IV. Computational Results
6. Sec. V. Summary, Conclusions, Discussions
7. Appendix A MATLAB functions used and brief implementation explanation as well as the actual codes
8. Appendix C (optional) Any algebraically intense calculations (long and drawn out calculations have no business in Sec. II!)

5 Presentation

You and your partner(s) will prepare a 15-minute oral presentation written either in PPT or \LaTeX on May 11, 5-7pm. You can refer to the guidelines from

<http://www.csulb.edu/~jchang9/files/howToOralPresentation.pdf>.
